Speech Synthesis Markup Language (SSML)

This tutorial demonstrates how to modify speech synthesis in real-time within your text.

Last Updated: 5/14/2019

How To Do It

First, I need to give credit where credit is due. I didn't actually created this tutorial - instead, it was inspired and the video was created by [Sebediah](#). I'm merely moving his information into this tutorial for others to find.

If you're looking for the thread that started this conversation, find it here:

Sebediah figured out that you can include SSML code in your text to speak. He also created a fantastic tutorial video, which you can see below.

Here's an example of code he provided to give you a head start before the video: `` `

#The tag is only needed if you're going to make other changes mid-sentence, otherwise you can just use the first tag and don't need the second one after the string.

```
$VoiceStart = "<prosody pitch ='+230%'" $VoiceEnd = "</prosody>"
```

```
SayWait($VoiceStart + "When I'm tired my voice gets very deep and I speak slowly" +  
$VoiceEnd) `` `
```
